Residents-As-Teachers Conferences

Title: Exit Rounds (Reflective Learning in Medicine)

Goals: Residents should be able to:

1. Describe Reflection as an educational theory.

2. Appreciate the usefulness of Exit Rounds as reflective teaching tool.

Format:

- Icebreaker: how does experiential learning work 5 mins.
- Mini-lecture/discussion: Schon's experiential learning model; examples of teaching "surprises" (brainstorm?) 15 mins.
- Mini-lecture: Exit Rounds 5 mins.
- Demonstration role play of Exit Rounds 10 mins.
- Questions-and-answers 5 mins.

Materials:
- overheads (goals, Schon model, Exit Rds steps, teaching surprises)
- articles (Arseneau)
- handout (Schon model)
- role play

Exit Rounds
(Reflective Learning in Medicine)

Goals: Residents should be able to:

1. Describe Reflection as an educational theory.

2. Appreciate the usefulness of Exit Rounds as reflective teaching tool.
Model of Learning from Experience (Schon)
Five Stages of "Reflective Practice"

1st Stage: Knowing-in-action

- automatic, deeply-embedded, action-oriented knowledge and skills
- makes up most of the practices of physicians
- Ex. using a set dosage of an antibiotic

2nd Stage: Surprises

- uniqueness, conflict, or ambiguity
- Ex. inconsistent finding on a physical exam

3rd Stage: Reflection-in-action

- reconstruct knowledge &
skills, and events
  • occurs during physician-patient interaction
  • a response to the Surprise is developed

4th Stage: Experiment
  • attempt something to gain more information or resolve dilemma
    • ad hoc in nature
    • Ex. rephrase a question; change a dose

5th Stage: Reflection-on-action
  • after patient encounter completed
    • reflect back to make sense of Surprise, the reflection-in-action, and the Experiment
    • may complete loop and impact new Knowledge-in-action (e.g.,
new frame of reference)

EXIT ROUNDS

• experience alone is not the key to learning
• students/residents are subjected to half-digested practical work or experience

Four Types of Knowledge:

1. Declarative: labels and lists.

3. Problem-solving: identify causal connections and apply to problems.

4. Personal-insight: awareness of belief's and assumptions that inform one's actions.

Steps for Conducting Exit Rounds

1. Establish a clear understanding with the students of the purposes and intentions behind Exit Rounds.

2. Listen to each student as s/he describes patient presentation, hospital course, etc.
3. Provide cues for missing elements of the story.

4. Ask each student what was important or meaningful about the case; ask "what did you learn?"

5. Elicit the student's emotions (when appropriate).

6. Probe for understanding; encourage student to explore beliefs, rules, knowledge content and approach to learning.

Case Example

A senior medical student is asked to briefly summarize the case of a recently discharged patient and what she learned from caring
for this patient. The patient presented with an exacerbation of congestive heart failure. The student's summary misses only a few details. She reports learning how to treat CHF. On questioning, the attending discovers that the student has learned a "recipe" approach, and she reveals a poor understanding of the rationale for the treatment choices. Further, she has a fragmented and incomplete conceptualization of CHF.
Role Play

Resident:

History: I have a 50 year old white female who comes in today complaining of fatigue and loose stools. This has been going on for about 3 months. These symptoms seem to be getting worse, and she's worried it might be due to Chronic Fatigue Syndrome. She has hypertension and is on a beta-blocker for that. Review of systems is otherwise negative.

Physical exam: BP = 140/82, P = 84. Her exam is essentially unremarkable. HEENT is benign, lungs clear, cardiac normal, no edema.
Teaching "Surprises"

* after carefully demonstrating a physical exam technique, you observe the learner performing it incorrectly

* staying current is important to you, and you always hand out articles; however, you find out a learner doesn't really know how to critically appraise articles

* during Work Rounds, you frequently ask the student to read the ECG; for this month, this approach seems to add 10 mins
* at Sign-Out Rounds, the management plans for patients discussed at Attending Rounds seem to be not implemented

* during Exit Rounds at the end of the week, you discover several incorrect causal connections (e.g., a goiter always needs a FNA)

**Model of Learning from Experience (Schon)**

**Five Stages of "Reflective Practice"**

1st Stage: Knowing-in-action

- automatic, deeply-embedded, action-oriented knowledge and skills
- makes up most of the practices of physicians
- Ex. using a set dosage of an antibiotic

2nd Stage: Surprises

- uniqueness, conflict, or ambiguity
- Ex. inconsistent finding on a physical exam

3rd Stage: Reflection-in-action

- reconstruct knowledge & skills, and events
- occurs during physician-patient interaction
- a response to the Surprise is developed

4th Stage: Experiment
- attempt something to gain more information or resolve dilemma
  - ad hoc in nature
  - Ex. rephrase a question; change a dose

5th Stage: Reflection-on-action

  - after patient encounter completed
  - reflect back to make sense of Surprise, the reflection-in-action, and the Experiment
  - may complete loop and impact new Knowledge-in-action (e.g., new frame of reference)
